

Top 10 Controversial Music Videos

Worth Your Clicks: The 25 Best Blogs of 2011 The demo showed only one aspect of Windows 8, but it was a lulu. Windows is getting its most dramatic makeover since at least Windows 95, with an all-new interface that looks a lot more like Windows Phone 7 rather than anything that currently runs on a desktop PC or laptop. It's clever, colorful and designed to be navigated with fingers rather than a keyboard and mouse, showing plenty of iPhone/iPad influence without being a mere knockoff.

The old-school Windows interface isn't gone; existing software will still run. But Microsoft is prepping for a transition similar to the migration from DOS to Windows that happened a couple of decades ago. It may take a while to complete, but it's under way.

Coming to any definitive conclusions about Windows 8 on the basis of last week's demos would be like reviewing a movie on the basis of a teaser trailer that came out a year and a half before the film. (Microsoft isn't saying when the software will ship, but mid- to late 2012 is a good bet.) The sneak peek was enough to leave me asking a lot of questions, though:

Will Windows 8's dual interface feel like the best of both worlds rather than a disjointed mess? Making it make sense will be a massive challenge. (I'm keeping an open mind until I get some hands-on time.)

	For my current work and lifestyle my old PC works just fine for most of my computer needs. If I go post-PC, it will not be because it's no longer trendy or hi-tech or articles like this that pronounce its coming death, it will be because it no longer works or something works better enough to justify the costs and learning involved.

	None of them were right. The "trends" in computing are based on technology, not what Microsoft or Linux or Google or Apple sells. It is determined by what people buy and use. Cloud computing is nothing more than a return to mainframe computing of the 1970s. It worked OK then, but it has outgrown its place in technology. Microsoft has NEVER determined what works in computing. MS typically borrows someone else's idea and makes show more

	Typical, You forgot Linux, which now runs on the tiniest devices to the largest computers in the world. Linux is found EVERYWHERE and most people don't even know they are using it. Linux IS the future of computing and it is here NOW!
